

Gain valuable insights on infrastructure health and performance across data centers from the cloud using Dell CloudIQ

Dell CloudIQ provides a single console for proactive monitoring and had negligible impact on network bandwidth in our tests

Securely monitoring infrastructure and sending monitoring and alerting data from Dell OpenManage Enterprise (OME) to CloudIQ didn't tax network performance

Across the network, we sent:

- 1 Metrics** System telemetry monitoring (such as CPU and memory utilization)
- 2 Health** Regularly updated system Health status
- 3 Alerts** Notifications of hardware events as reported by iDRAC
- 4 Inventory** Detailed inventory for hardware and firmware, with automatic refresh on any changes

And this monitoring had low impact on network bandwidth:

3 servers

0.089 KBps

(average transfer over the network)
